"CASE STUDY"

Jellyrolls

Jellyrolls is a designer ladieswear boutique situated in the fashionable Stonygate area of Leicester. The decision to have a **MonitoredShop** security system installed was made following a break-in where thieves managed to get away with thousands of pounds of designer wear.

Once the BCRU were aware of their need information and contracts were dispatched immediately and the installation was completed within days of the request.

During a recent telephone conversation, Michelle Taylor, the boutiques Manager, said *"having the system installed has made us all feel better about leaving the premises, when we lock up at night we know that things are being looked after in our absence"*

When asked about the lone worker panic facility Michelle said *"having the panic alarm certainly gives peace of mind when I'm working alone, being able to activate the system and summon help by just pressing a button on my fob is a real bonus"*

The benefits of having the **MonitoredShop** security system installed are clear to see, their deterrent value dramatically reduces the chances of becoming a victim of either burglary or personal attack and should the worst happen you have the comfort of knowing your situation is in the capable hands of the **MonitoredShop** professionals

If you believe your business would benefit from the installation of a **MonitoredShop** security system please contact us on the number at the top of this sheet alternatively click www.bcru.org/applynow.php

MonitoredShop

The Security System

The **MonitoredShop** security system can, in many cases, be installed with no capital outlay and is designed to provide so much more than just security; there are a variety of sensors which expand the systems detection and reporting abilities to cover smoke, gas, CO2 and flood as well as its incredible lone worker assistance functionality which now comes as standard with all Monitored Shop installations.

Lone Worker Support

A very exciting feature of the **MonitoredShop** security system is the lone worker support facility which enables users to initiate a silent activation and open the audio connection to the alarm receiving centre.

The system can be programmed to offer silent, discrete or full bells activations or, with additional activators, a combination of all three. The Alarm Receiving Centre (ARC) are able to differentiate between activators which means that the response mechanism offered can be tailored to the specific needs of your organisation dependant on how the system is triggered.

When the system is activated an audio link is opened between the ARC operator and the systems control panel enabling voice communications directly between the two. The operator is able to listen and speak or to listen discretely to assess the situation.

The available responses can be further refined with the introduction of passwords; the use of a duress password would indicate to the operator that the situation requires response escalation and a stand down password would indicate that all is well.

This feature has proven to be very popular with customers that find themselves in a situation where they are alone with a visitor or customer which, whilst not dangerous, still makes them feel uncomfortable. Simply having the ability to press a button and hear a friendly voice adds a level of comfort that couldn't be gained in any other way; it also sends a clear message to the visitor or customer that both the premises and the lone worker are protected.

Control Panel

The central processing unit is fully equipped with an onboard keypad, 110db sounder, simplex 2 way voice communication, digital communicator and easy to follow voice menus for local and remote operations

MonitoredShop

from the **BCRU** Business Crime Reduction Unit

Flood Detector

Detects and reports build ups of fluid as an early warning of flood or process overflow

Door & Window Contacts

Detects the opening of the door or window to which it is attached

4 Button Fobs

Remote Setting & Un-setting Fob with integral Lone Worker activator

Gas & CO Detectors

Wide range of gas and carbon monoxide detectors available

Smoke Detectors

Local audible & remote reporting smoke optical technology smoke detector with brigade response

Movement Detectors

Detects a combination of heat and movement within its 25 metre range

Supply chain accreditations
